Code Sight

Find and fix application security defects as you code

Benefits for Developers

Intuitive workflow

- Fix weak code and vulnerable open source dependencies without having to be a security expert
- Get automatic alerts for issues in every file you open, save, and edit, or manually run rapid scans on demand
- Install and start writing moresecure code within minutes

Better code

- Address issues in source code, open source dependencies, API calls, cryptography, infrastructureas-code, and more
- Instantly see how to fix issues with clear guidance that helps developers become more riskaware and security-capable
- Become a security champion with access to interactive developer security training from Secure Code Warrior

Increased productivity

- Avoid rework by resolving issues before checking-in code
- Keep moving quickly with IDEoptimized rapid scanning
- Reduce the vulnerability backlog for security teams by eliminating issues before downstream tests

Overview

A developer's role may not be strictly tied to security, but they have a direct impact on the security risk posture of their projects and of the organization. They need insight into risks as they code, and they need to understand how to fix an issue that entered the project inadvertently.

Developers need all this as part of their workflow, without additional steps or tools that may adversely affect productivity.

Code Sight[™] is an IDE plugin that helps developers uphold higher standards for application security without switching tools or interrupting their day-to-day tasks. Combining static application security testing (SAST) and software composition analysis (SCA), Code Sight delivers real-time alerts and visibility into

- Security weaknesses (CWEs) in their code
- · Known vulnerabilities (CVEs) in open source dependencies
- Insecure infrastructure-as-code (IaC) configurations
- · Potential secrets/sensitive data leakage risks
- · Vulnerable API usage

Designed for rapid DevOps workflows and CI pipelines, Code Sight can analyze large projects and file structures in seconds, with automation controls to scan whole codebases or modified projects. This allows teams to address defects before checking-in code and avoiding costly rework required when vulnerabilities aren't discovered until downstream testing.

Code Sight complements and improves the effectiveness of other application security testing (AST), alerting development teams to issues detected by other Synopsys AST tools and associated security policy violations. To help developers to quickly fix issues, Code Sight provides detailed remediation guidance directly in the IDE, with recommendations for open source patches, coding best practices, and links to interactive developer security training, powered by Secure Code Warrior.
